Sequence 1, Application US/09214808A

Batent No. 6475793

GENERAL INFORMATION:

APPLICANT: Resenthal, Andre

APPLICANT: Freiberg, Christoph

APPLICANT: Perret, Xavier Philippe

APPLICANT: Percet, Xavier Philippe

APPLICANT: Parcet, Xavier Philippe

TITLE OF INVENTION: Genomic Sequence of Rhizobium SP. NGR 234 Symbiotic

Patent No. 6475793

TITLE OF INVENTION: Plasmid

TITLE REFRENCE: CARPO068

CURRENT FILING DATE: 1999-06-22

PRIOR PRILICATION NUMBER: US/09/214,808A

PRIOR FILING DATE: 1997-07-10

NUMBER OF SEQ ID NOS: 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 30616, Application US/09513999C

Patent No. 6783961

GENERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Duclert, A.
TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

Publication No. US20050202414A1
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: The Regents of The University of California
APPLICANT: Jia, Xi Yu
APPLICANT: Berger, Martina M
APPLICANT: Herger, Martina M
APPLICANT: APPRARATUS AND METHODS FOR DETECTING A PATHOGEN IN A SAMPLE
FILE OF INVENTION: APPRARATUS AND METHODS FOR DETECTING A PATHOGEN IN A SAMPLE
CURRENT APPLICATION NUMBER: US/10/295, 787D
CURRENT FILING DATE: 2002-11-15
PRIOR FILING DATE: 2001-11-15
APPLICANT: Berger, Martina M
APPLICANT: Tilles, Jeremlah G
TITLE OF INVENTION: APPARATUS AND METHODS FOR DETECTING A PATHOGEN IN A SAMPLE
FILE REFERENCE: UCIVN--015A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    APPLICANT: Jia, Xi Yu

                                                                                                                                                                                             sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of muclaic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at come or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveillance, bioterrorism countermeasures, environmental pathogen surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunoassays and ELISA, are difficult to implement, time consuming, expensive, outdated, and typically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot microbes overcomes these disadvantages. The apparatus is compact, sensitive, and quick to detect the presence of any of a number of any pathogens present in a sample. The present sequence is that of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

```
This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus corviral particle, (non-) pathogenic bacteria, or cellular or accellular microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveillance, bioterrorism countermeasures, convironmental pathogen surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunosassays and BLISA, are difficult to implement, time consuming, expensive, outdated, and contamination or membrane con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 bound proteins or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus or device for detecting microbes overcomes these disadvantages. The apparatus is compact, sensitive, and quick to detect the presence of any of a number of pathogens present in a sample. The present sequence is that of an oligonucleotide probe which is related to the micorbe detection apparatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel microbe detection apparatus-related oligonucleotide probe SegID20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                     New (microarray) apparatus comprising a substrate with attached nuc
acid probes, useful for detecting one or more microbes in a sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    microbe detection; microbe identification; virus; viral particle;

This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for componentary to a target nucleic acid to provide a detectable signal at one or more microbes in a sample, such as virus comporting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acellular convironmental pathogen surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunoassays and ELISA, are difficult to implement, time consuming, expensive, outdated, and trypically rely on the use of agents that recognise and bind to membrane conductions or carbohydrates of the pathogen. These further cannot miltiple pathogens. The new apparatus or device for detecting microbes overcomes these disadvantages. The apparatus is compact, sensitive, and quick to detect the present sequence if any of a number of an apparatus or appendent of an apparatus or apparatus of an apparatus or apparatus of an apparatus or apparatus or apparatus of an apparatus or apparatus or apparatus of an apparatus or ap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    igonucleotide probe which is related to the micorbe detection apparatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel microbe detection apparatus-related oligonucleotide probe SeqID18.
                                                                           New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
